

Minimum Spanning Trees

Chapter 23

Minimum Spanning Tree

- Problem: given a connected, **undirected**, weighted graph $G(V,E)$ and a weight function $w: E \rightarrow \mathbb{R}$

Minimum Spanning Tree

- Problem: given a connected, undirected, weighted graph, find a **spanning tree** T that connects all V of **minimal** weight

Minimum Spanning Tree

- Which edges form the minimum spanning tree (MST) of the below graph?

Minimum Spanning Tree

- Which edges form the minimum spanning tree (MST) of the below graph?

Minimum Spanning Tree

- Which edges form the minimum spanning tree (MST) of the below graph?

Minimum Spanning Tree

- Which edges form the minimum spanning tree (MST) of the below graph?

Minimum Spanning Tree

- Answer:

Minimum Spanning Tree

Figure 1: Minimum spanning tree.

- Here we have two different MSTs for the same graph with equal costs and edge weights

Minimum Spanning Tree

- MSTs satisfy two powerful properties:
 - Optimal substructure
 - An optimal tree is composed of optimal subtrees
 - Greedy choice
 - A locally optimal choice is globally optimal

Optimal subtree property

- **Optimal substructure** property: an optimal tree is composed of optimal subtrees
 - Let T be an MST of G with an edge (u,v) in the middle
 - Removing (u,v) partitions T into two trees T_1 and T_2

Optimal subtree property

- Claim: T_1 is an MST of $G_1 = (V_1, E_1)$, and T_2 is an MST of $G_2 = (V_2, E_2)$

Optimal subtree property

- Proof: cut and paste
- $w(T) = w(u,v) + w(T_1) + w(T_2)$
(There can't be a better tree than T_1 or T_2 , or T would be suboptimal)

Greedy Choice

- A locally optimal choice is **globally optimal**
- Thm:
 - Let T be MST of G , and let $A \subseteq E(T)$
 - Let S be a subset of V such that $E(S, V-S)$ has no intersection with A
 - Let (u,v) be min-weight edge connecting S to $V-S$

Then there is an MST of G , T' such that $A \subseteq E(T')$ and $(u,v) \in T'$

Algorithms for MST

- Kruskal's algorithm
 - Based on the idea of connected components
 - Starts with a forrest, and always adds to the forrest the min edge that connects two different components
- Prim's algorithm
 - Starts with a tree, and always adds to the tree the min edge not yet in the tree

Algorithms for MST

- Kruskal's algorithm
 - Based on the idea of connected components
 - Disjoint sets
 - Starts with a forest, and always adds to the forest the min edge that connects two different components
- Prim's algorithm
 - Starts with a tree, and always adds to the tree the min edge not yet in the tree
 - Priority queues

Disjoint-Set Data Structures

- Want a data structure to support disjoint sets
 - Collection of disjoint sets $S = \{S_i\}$, $S_i \cap S_j = \emptyset$
- Need to support following operations:
 - $\text{MakeSet}(x)$: $S = S \cup \{\{x\}\}$
 - $\text{Union}(S_i, S_j)$: $S = S - \{S_i, S_j\} \cup \{S_i \cup S_j\}$
 - $\text{FindSet}(X)$: return $S_i \in S$ such that $x \in S_i$
- Before discussing implementation details, we look at Kruskal's algorithm

Kruskal' s Algorithm

```
Kruskal()  
{  
    T =  $\emptyset$ ;  
    for each v  $\in$  V  
        MakeSet(v) ;  
    sort E by increasing edge weight w  
    for each (u,v)  $\in$  E (in sorted order)  
        if FindSet(u)  $\neq$  FindSet(v)  
            T = T  $\cup$  {{u,v}} ;  
            Union(FindSet(u) , FindSet(v)) ;  
}
```

Kruskal's Algorithm

```
Kruskal()
```

```
{
```

```
  T =  $\emptyset$ ;
```

```
  for each  $v \in V$ 
```

```
    MakeSet( $v$ );
```

```
  sort E by increasing edge weight w
```

```
  for each  $(u,v) \in E$  (in sorted order)
```

```
    if FindSet( $u$ )  $\neq$  FindSet( $v$ )
```

```
      T = T  $\cup$  { $\{u,v\}$ };
```

```
      Union(FindSet( $u$ ), FindSet( $v$ ));
```

```
}
```

Run the algorithm:

Kruskal's Algorithm

```
Kruskal()
```

```
{
```

```
  T =  $\emptyset$ ;
```

```
  for each  $v \in V$ 
```

```
    MakeSet( $v$ );
```

```
  sort E by increasing edge weight w
```

```
  for each  $(u,v) \in E$  (in sorted order)
```

```
    if FindSet( $u$ )  $\neq$  FindSet( $v$ )
```

```
      T = T  $\cup$  { $\{u,v\}$ };
```

```
      Union(FindSet( $u$ ), FindSet( $v$ ));
```

```
}
```

Run the algorithm:

Kruskal's Algorithm

```
Kruskal()

Correctness Of Kruskal's Algorithm

- Sketch of a proof that this algorithm produces an MST for T :
 - Assume algorithm is wrong: result is not an MST
 - Then algorithm adds a wrong edge at some point
 - If it adds a wrong edge, there must be a lower weight edge to connect the subtrees
 - But algorithm chooses lowest weight joining two different components
 - Take S equal to one of the components and apply the theorem.

}
```

What will affect the running time?

1 Sort

$O(V)$ MakeSet() calls

$O(E)$ FindSet() calls

$O(V)$ Union() calls

(Exactly how many Union(s)?)

Kruskal's Algorithm: Running Time

- To summarize:
 - Sort edges: $O(E \lg E)$
 - $O(V)$ MakeSet()'s
 - $O(E)$ FindSet()'s
 - $O(V)$ Union()'s
- Upshot:
 - Best disjoint-set union algorithm makes above 3 operations take $O(E \cdot \alpha(E, V))$, α almost constant
 - Overall thus $O(E \lg V)$

Disjoint Sets (Chapter 21)

- So how do we implement disjoint-set union?
 - Naïve implementation: use a linked list to represent each set:

- MakeSet(): ??? time
- FindSet(): ??? time
- Union(A,B): “copy” elements of A into B: ??? time

Disjoint Set Union

- So how do we implement disjoint-set union?

- Naïve implementation: use a linked list to represent each set:

- MakeSet(): $O(1)$ time
 - FindSet(): $O(1)$ time
 - Union(A,B): “copy” elements of A into B: $O(A)$ time
 - How long will n Union()’s take?

Disjoint Set Union: Analysis

- Worst-case analysis: $O(n^2)$ time for n Union's
- Improvement: always copy smaller into larger
 - Maintains the length of the list
 - Weighted union heuristic
 - Union can still take $\Omega(n)$
- However, a sequence of m Make_Set, Union and FindSet operations, n of which are Make_Set, takes $O(m + n \lg n)$ (Theorem 21.1)

Disjoint-set union

- Another way to implement disjoint-set unions, and which is more efficient: **Disjoint-set forests**

Disjoint-set forests

- 2 heuristics make the operations efficient:
 - Union by rank
 - Path compression (FindSet)
- In this case, a sequence of m Make_Set, Union and FindSet operations, n of which are Make_Set, takes $O(m \alpha(n))$ (proof- Section 21.4)

Algorithms for MST

What will be the running time?

A: Depends on queue

Analysis

- Time = $\theta(V \times T(\text{ExtractMin}) + E \times T(\text{DecreaseKey}))$
- Analysis according to Queue implementation:

Q	T _{extract}	T _{decrease}	Total
Array	$O(V)$	$O(1)$	$O(V^2)$
Binary Heap	$O(\lg V)$	$O(\lg V)$	$O((E+V) \lg V)$
Fib Heap	$O(\log V)_{\text{amort}}$	$O(1)_{\text{amort}}$	$O(E+V \log V)$
